Charge 3:     Lake Erie Yellow Perch Management Plan .....	8
Charge 4:     Support QFC Modeling Efforts for Catch-at-Age Models .....	8
Acknowledgments .....	9
Literature Cited .....	9

**Note:** The data and management summaries contained in this report are provisional. Every effort has been made to ensure their accuracy. Contact individual agencies for complete state and provincial data. Data reported in pounds for years prior to 1996 have been converted from metric tonnes. Please contact the Yellow Perch Task Group or individual agencies before using or citing data published herein.

## **Introduction**

From April 2012 through March 2013, the Yellow Perch Task Group (YPTG) addressed the following charges:

1. Maintain and update centralized time series of datasets required for population models and assessment including:
  - a. Fishery harvest, effort, age composition, biological and stock parameters
  - b. Survey indices of young of year, juvenile and adult abundance, size at age and biological parameters
  - c. Fishing harvest and effort by grid.
2. Support a sustainable harvest policy by:
  - a. Examining exploitation strategies
  - b. Recommending an allowable harvest for 2013 for each management unit.
3. Assist the STC with the potential development of new exploitation strategies and completion of a Lake Erie Yellow Perch Management Plan.
4. Support QFC modeling efforts for catch-at-age models and harvest policies.

### **Charge 1: 2012 Fisheries Review and Population Dynamics**

The lakewide total allowable catch (TAC) in 2012 was 13.637 million pounds. This allocation represented a 7.8% increase from a TAC of 12.650 million pounds in 2011. For yellow perch assessment and allocation, Lake Erie is partitioned into four management units (Units, or MUs; Figure 1.1). The 2012 allocation by management unit was 1.800, 4.000, 7.000, and 0.837 million pounds for Units 1 through 4, respectively. In 2012, the LEC set the TAC for MU1, MU2, and MU3 higher than the mean RAH values suggested in the March 2012 YPTG report (1.364, 3.926, and 5.710 million pounds, respectively) and the MU4 TAC was set at the mean RAH (YPTG 2012). The lakewide harvest of yellow perch in 2012 was 10.786 million pounds, or 79.0% of the total 2012 TAC. This was a 12.1% increase from the 2011 harvest of 9.620 million pounds. Harvest by Lake Erie Management Units 1 through 4 was 1.729, 3.729, 4.677, and 0.651 million pounds, respectively (Table 1.1). The portion of TAC harvested was 96.1%, 93.2%, 66.8%, and 77.7%, in MUs 1 through 4, respectively. In 2012, Ontario harvested 6.901 million pounds, followed by Ohio (3.482 million lbs.), Pennsylvania (203 thousand lbs.), New York (106 thousand lbs.), and Michigan (93 thousand lbs.).

Ontario's fraction of allocation harvested was 103.0% in MU1, 102.9% in MU2, 102.9% in MU3, and 103.6% in MU4 (see comments below regarding Ontario's harvest reporting and commercial ice allowance policy). Ohio fishers attained 97.6% of their TAC in the western basin (MU1), 85.1% in the west central basin (MU2), and 32.9% in the east central basin (MU3). Michigan anglers in MU1 attained 56.9% of their TAC. Pennsylvania fisheries harvested 15.1% of their TAC in MU3 and 45.0% of their TAC in MU4. New York fisheries attained 41.0% of their TAC in MU4.

Ontario's portion of the lakewide yellow perch harvest decreased slightly to 64.0% in 2012 from 66.2% in 2011 (Table 1.1). Ohio's proportion of lakewide harvest increased to 32.3% in 2012, from 29.4% in 2011. Harvest in Michigan, Pennsylvania, and New York waters combined represented 3.7% of the lakewide harvest in 2012.

Ontario continued to employ a commercial ice allowance policy implemented in 2002, by which 3.3% is subtracted from commercial landed weight. This step was taken so that ice was not debited towards fishers' quotas. Ontario's landed weights in the YPTG report have not been adjusted to account for ice content. Ontario's reported yellow perch harvest in tables and figures is represented exclusively by the commercial gill net fishery. Reported sport harvests for Michigan, Ohio, Pennsylvania, and New York are based on creel survey estimates. Ohio, Pennsylvania, and New York trap net harvest and effort are based on commercial catch reports of landed fish. Additional fishery documentation is available in annual agency reports.

Harvest, fishing effort, and fishery harvest rates are summarized for the time period of 2000 to 2012 by management unit, year, agency, and gear type in Tables 1.2 to 1.5. Trends over a longer time series (1975 to 2012) are depicted graphically for harvest (Figure 1.2), fishing effort (Figure 1.3), and harvest rates (Figure 1.4) by management unit and gear type. The spatial distributions of harvest (all gears) and effort by gear type for 2012 in ten-minute interagency grids are presented in Figures 1.5 through 1.8.

Ontario's yellow perch harvest from large mesh (3 inches or greater) gill nets in 2012 was 4.5%, 16.7%, and 3.0% of the gill net harvest in MUs 1, 2 and 3, respectively, but was negligible in MU4 (0.2%). Harvest, effort, and catch per unit effort from (1) small mesh yellow perch effort (<3 inch stretched mesh) and (2) larger mesh sizes, are distinguished in Tables 1.2 to 1.5. Harvest from targeted small mesh gill nets in 2012 decreased 9.3% in MU1 and increased 18.1% in MU2, 25.5% in MU3, and 7.5% in MU4 from 2011 harvest. Ontario trap net harvest is minimal (115 pounds in 2012) and is included in the total harvest of yellow perch in MU1 (Tables 1.1 and 1.2). Ontario commercial smelt trawlers incidentally catch yellow perch in management units 2, 3

and 4, and this harvest is included in Tables 1.3 to 1.5. In 2012, 13,071 pounds of yellow perch were harvested in trawl nets in MU2, with an additional 247 pounds harvested in MU3 and 2,586 pounds in MU4.

Targeted gill net effort in 2012 increased from 2011 by 9.5% in MU2, 28.8% in MU3, and 13.2% in MU4, but decreased 12.7% in MU1. Gill net effort remained lower in 2012 compared to the 1990s and earlier decades (Figure 1.3). Targeted gill net harvest rates in 2012 decreased 2.6% in MU3, and 5.0% in MU4 from 2011, but increased 3.9% in MU1, and 7.8% in MU2 (Figure 1.4).

In 2012, sport harvest in U.S. waters increased 24.2% in MU1, 72.4% in MU2, and 26.6% in MU4 from 2011 harvest , but decreased 7.9% in MU3 (Figure 1.2). Angling effort in U.S. waters increased in 2012 from 2011 in MU1 (17.9%), MU2 (15.4%), and MU4 (9.3%), but decreased in MU3 (8.7%; Figure 1.3). Yellow perch sport harvest from Ontario waters is assessed periodically, but creel surveys were not performed in 2012.

Sport fishing harvest rates are commonly expressed as fish harvested per angler hour for those anglers seeking yellow perch. These harvest rates are presented in Tables 1.2 to 1.5. Compared to 2011 rates, harvest per angler hour in Ohio waters increased in MU1 (2.9%), MU2 (19.2%), and MU3 (9.8%), and also increased 8.0% in New York waters of MU4. Angler harvest rates decreased from 2011 in Michigan waters (29.4% in MU1) and in Pennsylvania waters (11.3% in MU3, 13.8% in MU4).

Angler harvest in kilograms per angler hour is presented graphically in Figure 1.4 for each management unit, by pooling jurisdictions' harvest weights and effort. In 2012, the sport harvest rate (in kg/hr) increased in all MUs; MU1 (5.4%), MU2 (49.3%), MU3 (0.8%), and MU4 (15.8%).

Harvest from Ohio, Pennsylvania, and New York commercial trap nets in 2012 increased 20.0% in MU2, 47.2% in MU3, and 17.7% in MU4. Compared to 2011, trap net effort (lifts) in 2012 increased in MU2 (21.2%), MU3 (88.7%), and MU4 (11.7%). There was no trap net harvest or effort in MU1 in 2012. In 2012, trap net harvest rates decreased from 2011 in MU2 (1.1%) and MU3 (22.2%), and increased in MU4 (5.6%).

### ***Age Composition and Growth***

Lakewide, the yellow perch harvest in 2012 consisted mostly of age-4 fish (2008 year class, 36.7%), with a fair contribution of age-5 fish (2007 year class, 30.6%), and the pooled older cohorts (ages 6+, 20.2%; Table 1.6). In MU1, age-4 (2008 year class, 38.2%), age-5 (2007 year class, 22.7%), and age-3 (20.4%) fish contributed the most to the fishery. In MU2,

the major age groups were age-4 (2008 year class, 42.1%) and age-5 (2007 year class, 35.6%). In MU3, age-5 (2007 year class, 32.1%), age-4 (2008 year class, 31.7%), and age-six-and-older (31.2%) fish contributed the most to the fishery. In MU4 the principal ages harvested were age-4 (2008 year class, 39.4%) and age-2 (2010 year class, 27.8%).

Yellow perch growth differs among life stages and between basins as illustrated by trends in total length-at-age (Figure 1.9). For simplicity, Figure 1.9 is comprised of young-of-the-year data from summer and fall interagency trawls, while data for age-1 and successive ages to age-4 are from Ontario Partnership gill net surveys (MUs 1 and 4) and Ohio fall trawls (MUs 2 and 3). As these data are taken from fall surveys, caution must be exercised when evaluating these figures. Seasonal exploitation patterns and density-dependent effects may alter the overall picture of growth trends. In addition, separate surveys in the same MU may show dissimilar trends in size-at-age due to north-south growth differences or fishery influences. However, size-at-age long-term time series results describe relatively stable length-at-age for ages 0 to 4 across the management units. Yellow perch condition in Figure 1.10 is comprised of data from Ontario Partnership gill net surveys (MUs 1 and 4) and Ohio fall trawls (MUs 2 and 3). Trends in condition may be influenced by seasonal differences in sampling. Additional data from Long Point Bay trawl surveys are used to determine condition of age-0 yellow perch in MU4.

The task group continues to update yellow perch growth data in: (1) weight-at-age values recorded annually in the harvest and (2) length- and weight-at-age values taken from interagency trawl and gill net surveys. These values are applied in the calculation of population biomass and the forecasting of harvest in the approaching year. Therefore, changes in weight-at-age factor into the changes in overall population biomass and determination of recommended allowable harvest (RAH). In 2007, the YPTG moved from using a two-year average of weight-at-age to using a three-year average, and this was format continued in 2012. This was done to minimize the impacts of weak year classes on determining the mean weight-at-age of yellow perch in the population and in the harvest.

### ***Statistical Catch-at-Age Analysis***

Population size for each management unit was estimated by statistical catch-at-age analysis (SCAA) using the Auto Differentiation Model Builder computer program (ADMB), with a standard version that incorporates commercial gill net catchability coefficients based on the seasonal distribution of harvest and relative catch rates. Estimates of population size from 1993 to 2012 and projections for 2013 are presented in Table 1.7. Abundance, biomass, survival, and

exploitation rates are presented by management unit graphically for 1975 to 2012 in Figures 1.11 to 1.14. Mean weights-at-age from assessment surveys were applied to abundance estimates to generate population biomass estimates (Table 1.8 and Figure 1.12). Population abundance and biomass estimates are critical to monitoring the status of stocks and determining allowable harvest.

Abundance estimates should be interpreted with several caveats. Inclusion of abundance estimates from 1975 to 2012 implies that the time series are continuous. Lack of data continuity for the entire time series weakens the validity of this assumption. Survey data from multiple agencies are represented only in the latter part of the time series (since the late 1980s); methods of fishery data collection have also varied. Some model parameters are constrained to constants, such as natural mortality, catchability, and selectivity blocks. This technique lessens our ability to directly compare abundance levels over three decades. In addition, commercial gill net selectivity is estimated independently in the latter part of the time series using gill net selectivity curves derived from index gillnet data by the method of Helser (1998), involving back calculation of length-at-age and weightings based on the monthly distribution of harvest-at-age. With catch-at-age analysis the most recent year's population estimates inherently have the widest error bounds; this is to be expected for cohorts that remain at-large under less than full selectivity in the population.

In the catch-at-age model, population estimates are derived by minimizing an objective function weighted by data sources including fishery effort, fishery catch, and survey catch rates. In 2011-2012, the YPTG group determined data weightings (referred to as lambdas in ADMB) using an expert opinion approach for evaluating potential sources of bias in data sets that could negatively influence model performance (YPTG 2012). These data weightings were also used in 2012-2013 and are presented in Appendix A Table 1.

### ***Recruitment Estimator for Incoming Age-2 Yellow Perch***

Age-2 yellow perch recruitment in 2013 was predicted by robust regression of juvenile yellow perch trawl and gill net indices against catch-at-age analysis estimates of two-year-old abundance in each management unit. All values were transformed by natural logarithm ( $\ln(x+0.01)$ ), and the regression equations included y-intercepts. Only survey data from within each individual management unit was used to project age-2 abundance in that management unit. Age-2 yellow perch recruitment in 2013 was calculated using the mean of age-2 values predicted

from the young-of-year and yearling indices that performed well in the regressions ( $r^2 > 0.50$ ) with age-2 abundance estimates (Appendix A Table 2). Data from trawl and gill net index series for the time period examined are presented in Appendix A Table 3, while a key that summarizes abbreviations used for the trawl and gill net series is presented as a legend in Appendix A Table 4.

Estimates of 2013 age-2 yellow perch recruitment (the 2011 year class) were 7.313, 13.178, 18.812, and 4.973 million fish in Management Units 1 through 4, respectively (Table 1.7, Appendix A Table 2). Due to year class strength and age-2 selectivity, the 2011 year class will have a small contribution to the fishery in all management units in 2013.

### ***2013 Population Size Projection***

Stock size estimates for 2013 yellow perch age-3-and-older were projected from statistical catch-at-age analysis (SCAA) estimates of 2012 population size and age-specific survival rates in 2012 (Table 1.8). Projected age-2 yellow perch recruitment from the 2011 year class (method described above) was added to the 2013 population estimate for older fish in each unit, producing the total standing stock in 2013 (Table 1.8). Standard errors and ranges for estimates are provided for each age in 2012 and following estimated survival from SCAA, for 2013. Descriptions of *min*, *mean*, and *max* population estimates refer to the age-specific mean estimates minus or plus one standard deviation (Table 1.8).

Stock size estimates for 2012 from SCAA in this report (Table 1.7) were higher than those projected previously in MU1, but were lower in MU2, and were similar to predicted values in MU's 3 and 4 (YPTG 2012). Differences in stock size estimates were due to additional data in the model. Current estimates of age-2 fish in 2012 are from the SCAA's first assessment of this cohort and as such have the widest error bounds.

Stock size estimates projected for 2013 were lower than 2012 in all management units (Table 1.8, Figure 1.11). Abundance projections for 2013 were 23.3, 45.3, 56.9, and 20.6 million age-2-and-older yellow perch in Management Units 1 through 4, respectively. Abundance estimates of age-2-and-older yellow perch in 2013 are projected to decrease by 20.6%, 23.3%, 17.4%, and 19.0% in MUs 1 through 4, respectively compared to the 2012 abundance estimates. Age-3-and-older yellow perch abundance in 2013 is projected to be 15.9, 32.1, 38.1, and 15.6 million fish in Units 1 through 4, respectively. Model estimates of abundance for age-3-and-older yellow perch for 2013 are projected to decrease from the 2012 estimates in MU2 (22.2%), and MU3 (21.2%), and increase in MU1 (0.6%) and MU4 (22.4%).

As a function of population estimates and mean weight-at-age from surveys, total biomass estimates of age-2-and-older yellow perch for 2013 are projected to decline in MU1 (9.8%), MU2 (17.9%), MU3 (14.7%), and MU4 (5.3%) compared to 2012 (Table 1.8 and Figure 1.12). In 2013, age-3 yellow perch (2010 year class) are expected to represent the largest fraction of biomass in MUs 1 and 4. In MUs 2 and 3, age-six-and-older yellow perch (pooled cohorts) are expected to represent the largest fraction of total biomass.

Estimates of yellow perch survival for age-3-and-older in 2011 were 49.7%, 57.1%, 63.6%, and 62.1% in MUs 1 to 4, respectively (Figure 1.13). In 2012, estimated survival rates of age-3-and-older fish were 47.7%, 51.0%, 52.0%, and 58.2% in Units 1 through 4 (Table 1.8 and Figure 1.13). Estimates of yellow perch survival in 2012 for age-2-and-older fish were: 54.3% in MU1, 54.4% in MU2, 55.3% in MU3, and 61.4% in MU4 (Table 1.8 and Figure 1.13). Survival estimates are a function of natural mortality and age-specific fishing mortality. Yellow perch SCAA models used in this report assume that natural mortality is 0.4, therefore mortality due to natural causes (33%) results in a survival of 67% before the effects of fishing are considered.

Estimated exploitation rates in 2011 were 21.6%, 12.3%, 4.3%, and 6.1% in Management Units 1 to 4, respectively, for age-3-and-older yellow perch. Exploitation rates for yellow perch age-3-and-older fish in 2012 were estimated at 24.0%, 19.9%, 18.7%, and 10.9%, for MUs 1 to 4, respectively (Figure 1.14). Estimates of yellow perch exploitation for age-2-and-older fish in 2012 were: 15.6% in MU1, 15.7% in MU2, 14.5% in MU3, and 6.9% in MU4 (Table 1.8 and Figure 1.14).

## Charge 2: Harvest Strategy and RAH

Fishing rates applied in 2013 are presented in Table 2.1, along with associated recommended allowable harvest (RAH) values for each management unit. These fishing rates are the same as those used in 2012. These interim harvest strategies were developed for a draft Yellow Perch Management Plan (YPMP; see Charge 3: Lake Erie Yellow Perch Management Plan) and tested using a yellow perch simulation (see YPTG 2010 report). The yellow perch simulation determined that fishing rates that were one-half of  $F_{msy}$  could support viable sport and commercial fisheries without inviting excessive biological risk. These target fishing rates applied to population estimates and their standard errors, were used to determine *min*, *mean*, and *max* RAH's for 2013 for each management unit (Tables 2.1 and 2.2).

Quota allocation by management unit and jurisdiction for 2013 was determined by the same methods applied in 2009-2012, using GIS applications of jurisdictional surface area of water within each MU (Figure 2.1). The allocation of shares by management unit and jurisdiction are:

Allocation of TAC within Management Unit and Jurisdiction, 2013:

<u>MU1:</u>	ONT	40.6%	OH	50.3%	MI	9.1%
<u>MU2:</u>	ONT	45.6%	OH	54.4%		
<u>MU3:</u>	ONT	52.3%	OH	32.4%	PA	15.3%
<u>MU4:</u>	ONT	58.0%	NY	31.0%	PA	11.0%

**Charge 3: Lake Erie Yellow Perch Management Plan**

With guidance from the STC, the YPTG was charged with supporting the development of a Lake Erie Yellow Perch Management Plan (YPMP). In February 2009, a draft YPMP was submitted to Michigan State University's Quantitative Fisheries Center (QFC) for a technical review of the background material, exploitation strategies and associated yellow perch simulation. Despite changes in simulation methodology that followed, risk assessment, population and fishery objectives remain outstanding. Interim fishing rates, developed for the draft YPMP, currently applied for RAH in MUs 1, 2 and 3 are  $\frac{1}{2}F_{msy}$ . They are 0.67, 0.67, and 0.70 for Management Units 1–3, respectively. In MU4, a more conservative fishing rate of 0.30 was chosen.

The LEC, STC, QFC, and stakeholder groups from all jurisdictions on Lake Erie have formed the Lake Erie Percid Management Advisory Group (LEPMAG), to address stakeholder objectives, modeling concerns, and exploitation policies for Lake Erie percids. During 2012, LEPMAG focused on walleye objectives and assessment models. LEPMAG also began a review of existing YPTG models and data sources, and began discussions on stakeholder objectives and catch-at-age modeling concerns for yellow perch. These discussions are expected to lead to updated statistical catch-at-age models and new exploitation strategies for yellow perch leading to the completion of a new Lake Erie Yellow Perch Management Plan.

**Charge 4: Support QFC Modeling Efforts for Catch-at-Age Models**

The LEPMAG, facilitated by the QFC, has begun a review of the yellow perch assessment models. This review will continue during the course of their discussion on yellow perch management, and the YPTG will support this endeavor. During December 2012, YPTG met with

the QFC to discuss existing yellow perch models and options for possible improvement. Model concerns discussed included catchability, selectivity, estimating recruitment, and migration between management units.

## Acknowledgments

The task group members wish to thank the following people for providing support to the task group during the past year:

- Tim Bader, Ann Marie Gorman, and Jeff Tyson of the Ohio Department of Natural Resources, Division of Wildlife;
- Karen Soper and Dr. Yingming Zhao of the Ontario Ministry of Natural Resources;
- Dr. Michael Jones, Lisa Petersen, and Matthew Catalano of Michigan State University's Quantitative Fishery Center;
- Dr. Carol Stepien and the Lake Erie Center of the University of Toledo;
- Richard Kraus and Patrick Kocovsky of the U.S. Geological Survey, Biological Resources Division, Sandusky.

The YPTG report could not be completed without the contributions of all Lake Erie staff from the Michigan Department of Natural Resources, Ohio Division of Wildlife, Pennsylvania Fish and Boat Commission, New York Department of Environmental Conservation, US Geological Survey – Biological Resources Division, and the Ontario Ministry of Natural Resources. In addition, the YPTG expresses thanks to the Great Lakes Fishery Commission for their continued support.

Note: Values in italics delineate harvest percentage by gear in each Unit, while the values in the 'All Gear' boxes are for lakewide harvest percentage by Unit.

**Table 1.7.** Yellow perch stock size (millions of fish) in each Lake Erie management unit. Abundance in the years 1993 to 2012 are estimated by statistical catch-age analysis. The 2013 abundance estimates use age-2 estimates derived from regressions of SCAA age-2 abundance values against tYOY and yearling trawl index values.

**Table 1.8.** Projection of the 2013 Lake Erie yellow perch population. Stock size estimates are derived from survival from 2012 abundance, and age-2 estimates for 2013 are derived from regressions of SCAA age-2 abundance against YOY and yearling survey indices (see Appendix A). Standard errors are produced from SCAA and regression analyses.

Figure 2.1 Calculations for subunit areas in the Yellow Perch Task Group Management Units.

**Appendix A Table 1.** Expert Opinion (EO) Lambda ( $\lambda$ ) values and relative number of terms associated with catch-at-age analysis data sources by management unit (Unit).

Unit	Data Source	$\lambda$	Relative Number of Terms
1	Commercial Gill Net Effort	0.8	1
	Sport Effort	0.7	1
	Commercial Trap Net Effort	0.5	1
	Commercial Gill Net Harvest	1.0	5
	Sport Harvest	0.9	5
	Commercial Trap Net Harvest	0.7	5
	Trawl Survey Catch Rates	1.0	3
	Partnership Gill Net Index Catch Rates	1.0	5
2	Commercial Gill Net Effort	0.8	1
	Sport Effort	0.8	1
	Commercial Trap Net Effort	0.6	1
	Commercial Gill Net Harvest	1.0	5
	Sport Harvest	0.9	5
	Commercial Trap Net Harvest	0.7	5
	Trawl Survey Catch Rates	0.9	4
	Partnership Gill Net Index Catch Rates	1.0	5
3	Commercial Gill Net Effort	0.8	1
	Sport Effort	0.8	1
	Commercial Trap Net Effort	0.6	1
	Commercial Gill Net Harvest	1.0	5
	Sport Harvest	0.8	5
	Commercial Trap Net Harvest	0.6	5
	Trawl Survey Catch Rates	1.0	4
	Partnership Gill Net Index Catch Rates	1.0	5
4	Commercial Gill Net Effort	0.8	1
	Sport Effort	0.7	1
	Commercial Trap Net Effort	0.6	1
	Commercial Gill Net Harvest	1.0	5
	Sport Harvest	0.7	5
	Commercial Trap Net Harvest	0.6	5
	NY Gill Net Survey Catch Rates	1.0	5
	Partnership Gill Net Index Catch Rates	0.9	5

**Appendix A Table 2.** Robust regression results from survey indices used for projecting estimates of age-2 yellow perch recruiting in 2013 by Management Unit; SE=standard error.

Appendix A Table 4. Legend. Lakewide trawl index codes and series names used in Appendix A Tables 2 and 3. All series are reported in arithmetic mean catch per hectare, except LPS41 and OPSF11-41, gill net indices which are reported in mean catch per lift. Abbreviations in Appendix T3 ending with a 'B' represent survey indices blocked by depth strata.
